One project. Two working interfaces.

We built **both a responsive full-stack website and a native Android app** for music-assisted Semester I learning. The app adapts the uploaded Android project; both share the approved syllabus and reddish-orange sunrise design.

2	91	10	EN / HI
Deliverables	Uploaded topics	Ordered units	Languages

Website: live, phone-friendly dashboard

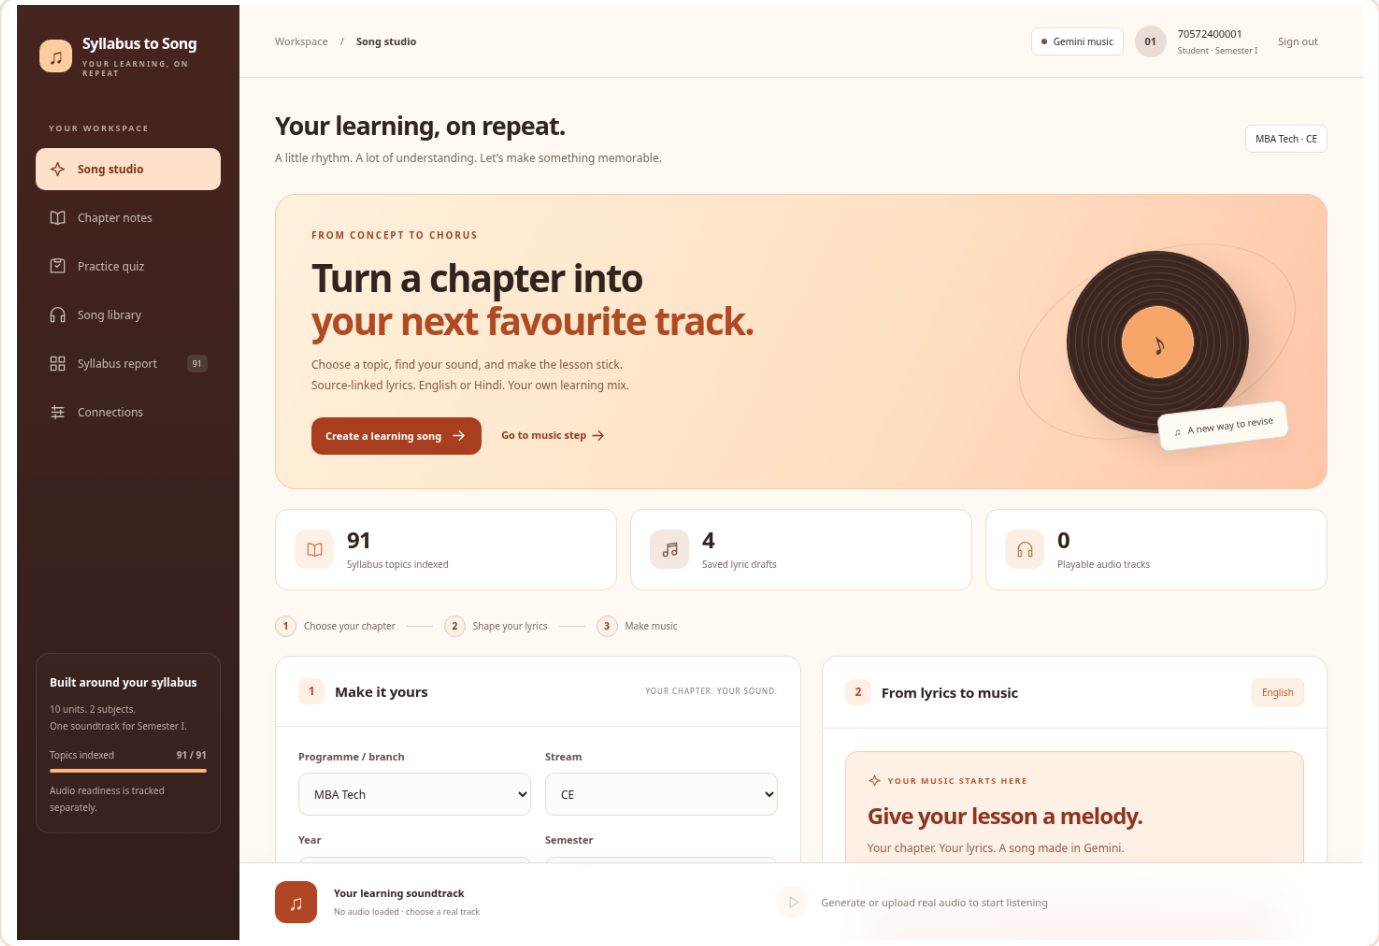

Sample SAP login, subject/chapter controls, lyrics, study tools, library/player and reviewed material uploads.

Android: installable demonstration APK

Android 8.0+, local drafts/library, native audio controls, study tools, ACE-Step connection and Gemini handoff.

Open the webpage: https://syllabus-to-song-studio.aptcat4096.chatgpt.site

Website access: owner-private; sign in with the owning ChatGPT account if prompted.

Website dashboard — real current UI with sample lyric drafts; no generated song is shown.

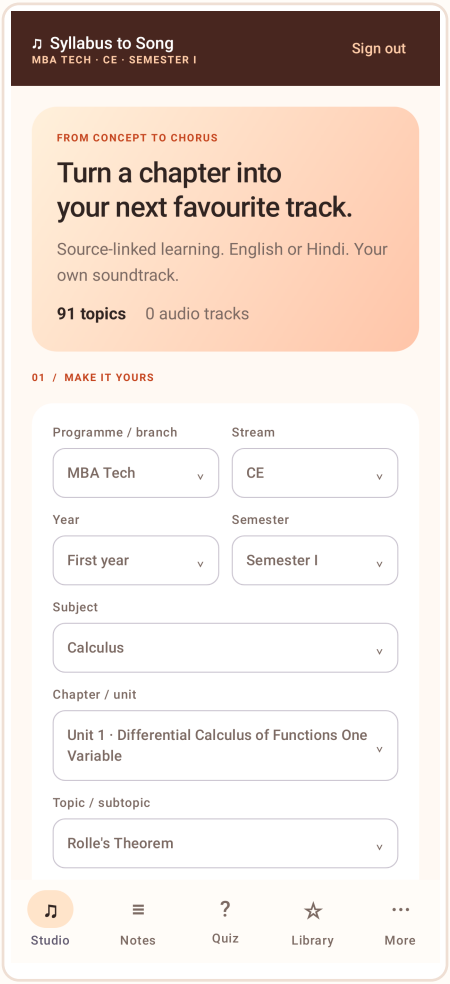

Shared learning flow

SAP login > MBA Tech / CE / Year 1 / Semester I > Calculus or BEEE > unit/topic > English or Hindi > style and lyrics > music route > permitted audio playback/export.

The native Android companion

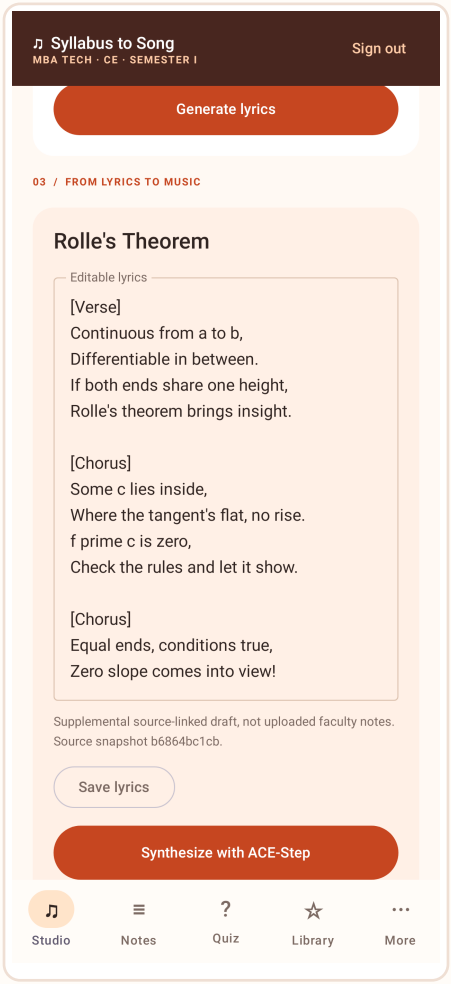

Kotlin + Jetpack Compose · SQLite song library · Android MediaPlayer · device-local drafts

Download the Android APK Install it, then tap “Try the sample student account”.

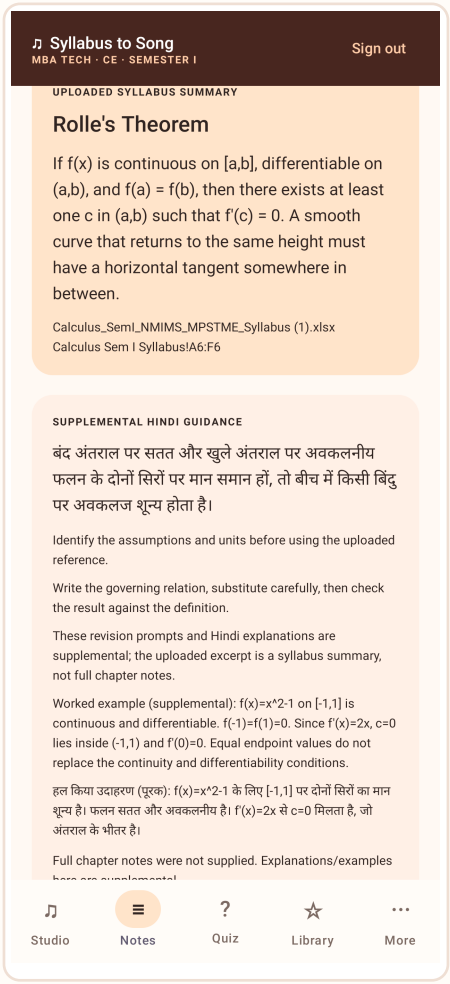

Chapter selection

Programme, semester, subject, unit and topic.

Lyrics & music controls

Editable drafts and the ACE-Step synthesis action.

Source-linked study

Uploaded summaries and labelled supplemental guidance.

Screens above are real app UI rendered with Robolectric, not physical-phone screenshots. No audio was generated for these captures.

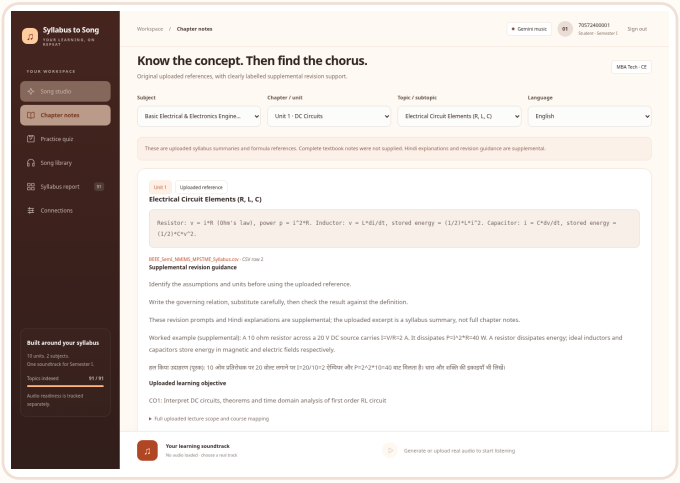

What the app adds

- Genre, mood, vocal delivery, tempo, length, difficulty, formula repeats and instructions.
- Local song history/favourites; play, pause, seek, replay, permitted audio import and export.
- Notes, bilingual quizzes, all-topic completeness and sample-admin material review.
- GPU connection-file import with encrypted key storage; Gemini browser fallback.

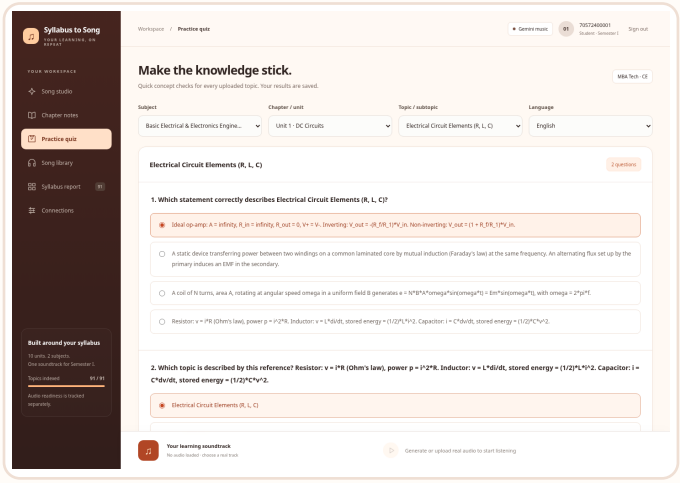

ACE-Step music needs an owner-run GPU

More > Music connection > connect the running free GPU notebook > generate/edit lyrics > Synthesize with ACE-Step. Free GPU availability and session limits apply. The phone does not host the model.

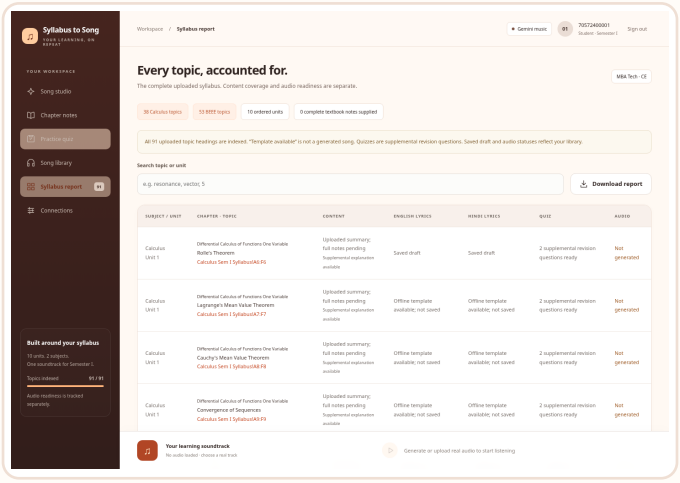

Learning features, with clear status

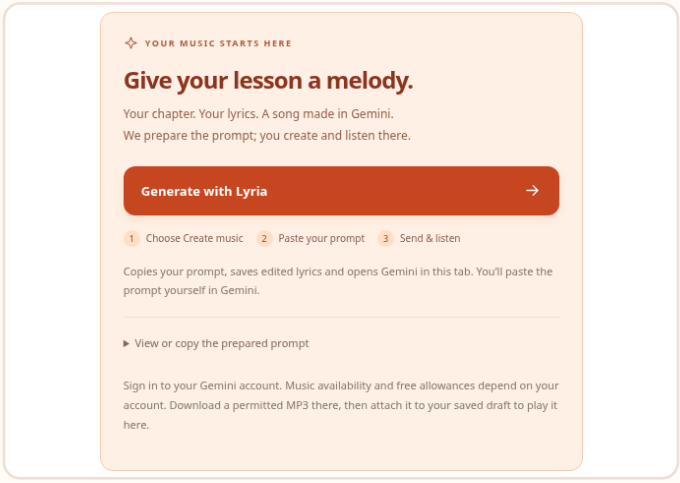

Chapter notes & formula references

Supplemental quizzes with feedback

Completeness report: every uploaded topic

Website music: Gemini / Lyria handoff

Academic scope

38 Calculus + 53 BEEE topics, in uploaded unit/topic order. Source excerpts, formulas, locators and supplied objectives are preserved. Full chapter notes were not supplied; generated guidance, lyric templates and quizzes are labelled supplemental.

Verified engineering work

38 Python checks; 7 ACE-Step protocol tests; 2 Robolectric/Compose flow tests; Android build/lint and APK signature verification. Website browser checks cover the song flow, all 91 report rows, fixture audio playback and 320/390/768px layouts. GitHub website and Android workflows passed.

Music-generation boundary

No real educational song or singing quality has been verified through this project. Gemini opens externally: choose Create music, paste and send. ACE-Step needs a running GPU and an actual generation/listening test. No song is fabricated. App and website libraries are separate; physical-device audio decoding remains unverified.
